Is your Cybersecurity fit for the future?

5 reasons why a multi-layered approach is best for the NHS

Layered Protection
Reduce the likelihood of malware infection with multiple layers of proactive and detective security

Simplicity
Keep cybersecurity simple to manage with the highest possible levels of protection, thereby minimising clinical and operational risk

Automated protection
Enable your defences to be as coordinated as the attacks they protect against

Servers and clinical systems
Protect both virtual and physical servers running Windows, Linux or Unix operating systems

Next-generation cybersecurity
Achieve even better protection when you combine Intercept X Advanced with Windows Defender ATP

A multi-layered approach works together to not only provide EDR capabilities but also to deliver the strong data and cybersecurity that the NHS aspires to. This is proactive cybersecurity protection that is fit for the future.
